1. Overview

This codebook defines how to annotate Russian- and Turkish-language news articles for this project. Each article is annotated along **four layers**. The first three are adapted from published SemEval shared tasks; the fourth is a project-specific open field that captures the culturally embedded language at the centre of our research.

1.1 The four layers

Layer	What it captures	Granularity	Adapted from
L1 Entity Roles	The role each central named entity is cast in (hero / villain / victim).	Span level (per entity mention)	SemEval-2025 Task 10, ST1 (collapsed to 3 roles)
L2 Frames	Which general aspects / angles the article foregrounds.	Document level (multi-label)	SemEval-2023 Task 3, ST2 (14 Media-Frames-Corpus frames)
L3 Persuasion	Which families of rhetorical / persuasive devices the article uses.	Span level (per technique instance)	SemEval-2023 Task 3, ST3 (collapsed to 6 coarse categories)
L4 Coded language	Insider phrases, metaphors, allusions hard for outsiders to read.	Open text (per instance)	Project-specific (KuKi)

1.2 How the layers relate

The layers are **independent** and annotated together for each article. An entity can be a Victim (L1) in an article that uses a Security and Defense frame (L2), argues through Attack on Reputation (L3), and contains one coded phrase (L4). You do not need any layer to “agree” with another. Annotate what the text supports for each layer on its own terms.

1.3 What counts as the article

- Annotate the content as provided.
- Your **personal opinion** about the frames or the entities is **irrelevant** and must not influence any label. Annotate how the *text* frames things, not whether you agree.

Golden rule

Label what is in the text, as a careful ordinary reader of that language and culture would understand it; not what you privately know to be true, and not what you suspect the author “really” means without textual support.

2. Annotation workflow

For each article, work through the layers in this order. The order matters: reading for entities first forces a close read that makes the later document-level judgements easier.

1. **Read the whole article once** without annotating, to form an overall impression.
2. **L1 Entity roles:** Reread and mark the central named entities and their role (zero or more).
3. **L2 Frames:** Decide which general frames the article foregrounds (one or more).
4. **L3 Persuasion:** Decide which persuasion families the article uses (zero or more).
5. **L4 Coded language:** Flag any insider phrase, metaphor or allusion, and describe it in your own words.

Each article is annotated independently by **two annotators**. There are **three annotators per language (six in total)**; each article is assigned to two of the three annotators for its language. Disagreements are resolved by a curator (see Section 8).

3. Layer 1 — Entity Roles (NER)

Adapted from SemEval-2025 Task 10, Subtask 1. We keep only the **three top-level roles** and drop all 22 fine-grained sub-roles. This collapse is deliberate: the coarse level transfers across languages far more reliably than the fine level.

3.1 Definition of a Named-Entity

- **Named entities** in a broad sense:
 - **Traditional named entities:** Specific **persons, organisations, and locations** (e.g., “Vladimir Putin,” “the UN,” “Moscow”).
 - **Toponym-derived and affiliation entities:** Phrases that **indicate a group** or collective identity based on a place, political, military, or organizational affiliation (e.g., “Trump supporters,” “residents of Ukraine,” “Russian forces,” “European officials” “Russian President Vladimir Putin”).
- **The Centrality Rule:**

You must **only** annotate named entities that are **central to the article's narrative**. Determining centrality requires a careful reading of the text. If an entity does not drive the story or suffer its main impacts, leave it unannotated.
- **Descriptive entity expressions.** When a named entity is modified by a descriptive title, function, or affiliation, annotate the **entire entity expression**, including the descriptor.
 - “**Russian President Vladimir Putin**” → annotate the whole phrase, not only “*Vladimir Putin*”.
 - “**former US President Donald Trump**” → annotate the whole phrase.
 - “**NATO Secretary General Mark Rutte**” → annotate the whole phrase.

The entity span should include all words that directly identify or describe the entity. Do not include surrounding words that merely describe an action or event.

- **What NOT to annotate:**
 - Generic / unnamed entities: Do not annotate purely nominal entity mentions such as “migrants,” “the public,” or “citizens.”
 - Settings without roles: Do not annotate locations or organizations if they are just the backdrop of the story and do not act or suffer harm.

3.2 Decision rules

1. Annotate the **complete entity span** on its first relevant occurrence.
2. If two entities are nested or overlap, prefer the **most complete meaningful entity expression**. For example, annotate *"Russian President Vladimir Putin"* rather than only *"Vladimir Putin"*.
3. **Do not annotate later pronouns** referring to an already annotated entity (e.g., *he, she, they, him, her, them, it*).
4. A repeated explicit mention of the same entity does **not** need to be annotated again if its role remains unchanged.
5. If the entity is presented in a **different role later in the article**, annotate the first mention where that new role becomes clear.
6. If it is unclear whether two mentions refer to the same entity, **prefer annotation over omission**. When in doubt, annotate the more complete plausible entity span rather than risk missing a relevant entity.
7. **Use the NONE label only when the text contains no central entity that drives the narrative.** This applies, for example, to neutral mentions of entities that do not play a meaningful role in the text.

Important: Do **not** use NONE simply because an entity has a neutral role. NONE should primarily be used when **no clear narrative structure is present**, such as in short news summaries, event listings, or chronological overviews that simply report a sequence of events without establishing clear protagonists, antagonists, or innocent parties.

Examples:

Test Case 1: Location as a mere setting

"**NATO troops** in **Africa** handing out candy to **the people**."

"**NATO troops**" is an affiliation entity doing a virtuous act → Annotate as PROTAGONIST.

"**Africa**" is a named location, but it is merely the setting here. It is not acting or suffering harm → Do not annotate.

"**the people**" are the beneficiaries, but it is a generic, unnamed phrase → Do not annotate.

Test Case 2: Location as an active entity

"**Moscow** threatened to cut off the winter gas supply to **Europe**."

"**Moscow**" is a named location, but here it acts as a political entity (a government) issuing a threat → Annotate as **ANTAGONIST**.

"**Europe**" is a named location, but here it is the direct target of the threat and potential harm → Annotate as **INNOCENT**.

Test Case 3: When to use NONE

The text provides a neutral chronological overview of events. No entity is presented as a clear **PROTAGONIST, ANTAGONIST, or INNOCENT**.

"On Monday, the government announced the new measures. On Tuesday, parliament discussed the proposal. On Wednesday, the measures were approved." → **NONE**

"The government introduced the new measures to protect vulnerable citizens, while opposition leaders accused it of deliberately harming low-income families." → **Do not use NONE.**

The text establishes a clear narrative structure: the **government** is presented as an actor and the **low-income families** as affected parties. The relevant entities should therefore receive the appropriate role labels.

If an entity is genuinely neutral, reported on factually with no positive or negative slant and no harm -> **do not force a role**.

Leave it unannotated. Only the three roles exist; neutrality is expressed by absence.

3.3 The three roles or None

PROTAGONIST the hero / the good actor

Definition. An entity the text presents positively: protecting values or people, doing good, standing up against a stronger force, acting virtuously, seeking peace, or fighting for change. The “good guy” of the article's story.

Look for. praise, admiration, framing as defender/guardian/victorious-underdog, moral approval, sympathy for a just cause.

Example. *An article that portrays volunteers delivering aid under shelling as selfless and brave casts those volunteers as PROTAGONIST.*

ANTAGONIST the villain / the bad actor

Definition. An entity the text presents negatively as a source of harm, threat, or wrongdoing: aggressor, oppressor, deceiver, corrupt actor, conspirator, traitor, foreign adversary, incompetent, etc. The “bad guy” of the article's story.

Look for. blame, accusation, framing as threat/aggressor/liar/corrupt, moral condemnation, attribution of bad motives.

Example. *An article describing a foreign government as orchestrating a covert plot to destabilise the country casts that government as ANTAGONIST.*

INNOCENT the victim / the harmed party

Definition. An entity presented as suffering harm, being exploited, overlooked, or unjustly blamed, through no fault of their own. They are acted upon rather than acting. Distinct from PROTAGONIST: the innocent does not necessarily fight back or embody virtue; they are primarily harmed.

Look for. suffering, harm, loss, being exploited/forgotten/scapegoated, helplessness, sympathy without heroism.

Example. *An article focusing on displaced families who lost their homes, with no agency of their own in the events, casts those families as INNOCENT.*

None when no other entity could be identified

Definition. NONE is a document-level status used when no qualifying role-bearing entity is present.

Example. *The text provides a neutral chronological overview of events. No entity is presented as a clear PROTAGONIST, ANTAGONIST, or INNOCENT.*

4. Layer 2 — Frames

Adapted from SemEval-2023 Task 3, Subtask 2, which uses the 14 generic frames of the *Media Frames Corpus* (Card et al., 2015). A frame is the **angle or aspect** the article foregrounds — the perspective from which the topic is presented. This is a **document-level, multi-label** task: most articles use more than one frame.

4.1 Definition

A frame is a strategic device for representing the different salient aspects and perspectives of an issue, in order to convey a particular latent meaning about it (Entman, 1993). The same topic can be discussed from different perspectives; the **frame is the perspective** — which aspects of the issue the article selects and makes salient.

Frame is not topic. The *topic* is what the article is about (“the war,” “a new pension law”). The *frame* is the angle through which that topic is presented (its costs, its legality, the threat it poses, its morality). One topic can be framed many ways; the same frame can appear across many topics.

What is NOT a frame. A passing mention is not a frame — the angle must be actually developed. The article's *subject matter*, its *named entities*, and its *stance* (for/against) are not frames. “An article about NATO” names a topic; whether it foregrounds NATO's military threat (Security & defense) or its budget (Economic) is the frame.

4.2 Decision rules

- **Multi-label.** Assign every frame the article genuinely foregrounds. Multiple frames per text are possible
- **Foregrounded, not merely mentioned.** A frame counts only if the article actually develops that angle and not because a single word brushes past it.
- **Frame ≠ topic.** “The war” is a topic; whether the article discusses it through casualties and threat (Security & defense), sanctions and prices (Economic), or international standing (External regulation & reputation) is the frame.
- Two of the most common frames in political news are **Political** and **Security & defense**. Do not over-apply them — assign only when that angle is actually developed.

4.3 The 14 frames

4.3.1 Overview

Frame	The article foregrounds...
Economic	costs, benefits, financial/market implications, economic consequences.
Capacity & resources	availability or lack of physical, human, or institutional resources.
Morality	right vs. wrong, religious or ethical duties, moral judgement.
Fairness & equality	(in)equality, balance of rights/treatment between groups.
Legality, constitutionality, jurisprudence	laws, courts, constitutional questions, legal rights/processes.
Policy prescription & evaluation	proposed solutions, whether a policy will / does work.
Crime & punishment	crimes, offenders, sanctions, enforcement, punishment.
Security & defense	threats, safety, military/defence, protection from danger.
Health & safety	health, disease, sanitation, public-health safety.
Quality of life	wellbeing, daily life, happiness, standard of living.
Cultural identity	traditions, customs, social norms, group identity.
Public opinion	what the public thinks; polls, attitudes, social-media mood.
Political	politics, parties, elections, lobbying, political manoeuvring.
External regulation & reputation	a country's/actor's standing abroad; foreign relations, treaties, image.

4.3.2 Details

ECONOMIC

Definition. The costs, benefits, or other financial/monetary implications of the issue — for individuals, groups, institutions, regions, or the economy as a whole.

Look for. prices, costs, budgets, taxes, sanctions, trade, jobs, GDP, financial gain or loss.

Examples:

Positive example. *An article on a pension reform that centres on its cost to the state budget and its effect on inflation.*

Negative example. *An article that mentions a single budget figure in passing while focusing on whether the reform is constitutional is Legality, not Economic.*

CAPACITY & RESOURCES

Definition. The availability of, or lack of, physical, human, financial, or institutional resources — the capacity to carry something out.

Look for. shortages, supply, manpower, infrastructure, “not enough ...,” logistical capacity.

Positive example. *An article arguing that hospitals lack the staff and beds to handle a crisis foregrounds Capacity & resources.*

Negative example. *An article about hospital funding cuts framed around their cost is Economic; the resource-availability angle must be the focus here.*

MORALITY

Definition. The issue seen in terms of right and wrong, religious or ethical duties, conscience, or moral judgement.

Look for. moral duty, sin, ethics, “it is wrong/right to ...,” religious or value-based judgement.

Positive example. *An article condemning a policy as a moral betrayal of the country's duty to the vulnerable foregrounds Morality.*

Negative example. *An article calling a policy “unfair to one region” is Fairness & equality (group balance), not Morality, unless framed as an ethical or religious wrong.*

FAIRNESS & EQUALITY

Definition. The (in)equality or balance with which laws, treatment, resources, or rights are distributed across people or groups.

Look for. discrimination, equal/unequal treatment, balance of rights, “one group vs another,” justice as fairness.

Positive example. *An article arguing that a tax change benefits the rich at the expense of the poor foregrounds Fairness & equality.*

Negative example. *An article about whether a tax change is legal is Legality; the unequal-distribution angle must be present here.*

LEGALITY, CONSTITUTIONALITY, JURISPRUDENCE

Definition. The issue seen through laws, courts, constitutional questions, legal rights, or judicial processes.

Look for. courts, laws, the constitution, rulings, legal rights, jurisdiction, “unconstitutional,” “illegal.”

Positive example. *An article on whether a decree violates the constitution and may be struck down by the court foregrounds Legality.*

Negative example. *An article that a court “will discuss” a case but that focuses on the political fallout is Political, not Legality.*

POLICY PRESCRIPTION & EVALUATION

Definition. Discussion of specific policies or solutions proposed to address the issue, and assessment of whether they will or do work.

Look for. proposed measures, “the solution is ...,” evaluating whether a policy succeeds or fails, recommendations.

Positive example. *An article weighing whether a new subsidy scheme will actually reduce unemployment foregrounds Policy prescription & evaluation.*

Negative example. *An article that merely reports a policy exists, without proposing or evaluating it, does not use this frame.*

CRIME & PUNISHMENT

Definition. The issue seen in terms of crimes committed, offenders, law-breaking, enforcement, sanctions, or punishment.

Look for. crime, arrests, offenders, sentences, prosecution, punishment, law enforcement.

Positive example. *An article centred on the arrest and prosecution of officials for fraud foregrounds Crime & punishment.*

Negative example. *An article about whether an action is technically legal, with no offender or punishment, is Legality, not Crime & punishment.*

SECURITY & DEFENSE

Definition. Threats to the security of individuals, communities, or the nation, and measures of protection or defence against them.

Look for. threat, danger, attack, military, defence, safety from harm, protection, war.

Positive example. *An article on the threat posed by an enemy advance and the army's defence of a city foregrounds Security & defense.*

Negative example. *An article on the army's procurement budget, framed around its cost, is Economic; the threat/protection angle must be present here.*

HEALTH & SAFETY

Definition. Health care, disease, sanitation, well-being of the body, and (non-military) public safety.

Look for. illness, epidemics, hospitals, public health, accidents, safety standards.

Positive example. *An article on the spread of an epidemic and measures to protect public health*

foregrounds Health & safety.

Negative example. *An article on a military threat is Security & defense, not Health & safety, even though both concern “safety.”*

QUALITY OF LIFE

Definition. The effect of the issue on people's everyday lives, well-being, happiness, or standard of living.

Look for. daily life, well-being, living standards, comfort, happiness, ordinary people's experience.

Positive example. *An article describing how rising heating costs make ordinary families' daily lives harder foregrounds Quality of life.*

Negative example. *An article giving the macro inflation rate without reference to lived experience is Economic, not Quality of life.*

CULTURAL IDENTITY

Definition. Traditions, customs, language, social norms, heritage, or the identity of a group or nation.

Look for. tradition, heritage, national/ethnic/religious identity, customs, “our culture / values / way of life.”

Positive example. *An article defending a tradition as essential to national identity against outside influence foregrounds Cultural identity.*

Negative example. *An article about a religious moral duty is Morality; Cultural identity is about belonging and heritage, not right/wrong.*

PUBLIC OPINION

Definition. What the public thinks or feels about the issue: attitudes, polls, social-media mood, demonstrations of opinion.

Look for. polls, surveys, “the public believes,” approval ratings, social-media reaction, popular mood.

Positive example. *An article reporting that polls show most citizens oppose a reform foregrounds Public opinion.*

Negative example. *An article in which the author merely asserts a position is not Public opinion unless it reports what the public thinks.*

POLITICAL

Definition. The issue seen through internal politics: parties, elections, factions, lobbying, political manoeuvring, and the distribution of political power.

Look for. parties, elections, coalitions, ministers, lobbying, political rivalry, power struggles.

Positive example. *An article on how rival parties manoeuvre over a bill ahead of an election foregrounds*

Political.

Negative example. *An article on how a vote damages the country's standing with the EU is External regulation & reputation, not Political — though both may apply (see reminder below).*

EXTERNAL REGULATION & REPUTATION

Definition. A country's or actor's external relations, standing, image, or reputation abroad — including treaties, foreign relations, and international regulation.

Look for. foreign relations, diplomacy, treaties, sanctions from abroad, international image, reputation, “how the world sees us.”

Positive example. *An article on how a decision harms the country's reputation with international partners foregrounds External regulation & reputation.*

Negative example. *An article on internal coalition politics with no foreign dimension is Political, not External regulation & reputation.*

4.4 Edge Cases and close Frames:

Political vs. External regulation & reputation.

Political is a *internal* political process (parties, elections, manoeuvring).

External regulation & reputation is the actor's standing and relations *abroad*. A parliamentary vote is Political; how that vote damages the country's image with the EU is External regulation & reputation. Both can apply to one article.

Economic vs. Quality of life.

Macro figures (inflation, GDP, budgets) are **Economic**;

The same issue told through ordinary people's lived daily experience is **Quality of life**.

Security & defense vs. Health & safety.

Both involve “safety,” but **Security & defense concerns** threat / military / protection **from an adversary**,

while **Health & safety concerns** disease, accidents, and public health.

5. Layer 3 — Persuasion

Adapted from SemEval-2023 Task 3, Subtask 3. The original taxonomy has 23 fine-grained techniques grouped under **six coarse categories**; we annotate only the six. A **span-level, multi-label** judgement: which persuasion families does the article use? Many factual reports use **none** — that is a valid and expected outcome.

5.1 Definition

Persuasion techniques are rhetorical and psychological **devices used to influence the reader**, including but not limited to logical fallacies and appeals to emotion that support flawed or one-sided argumentation. The source taxonomy contains 23 techniques grouped into **six coarse categories**; we annotate only the six. It is a multi-label, multi-class task, we are annotating on the span level.

5.2. Decision rules

1. **Zero is valid.** A neutral factual report may use no persuasion techniques. Do not invent one.
2. **Multi-label.** Mark every span where a technique occurs; the same category can be marked on several spans, and several categories often co-occur.
3. **Mark the span, not the document.** Annotate the specific text span(s) that carry the technique; record *each* occurrence rather than a single document-level flag.
4. **Attack on Reputation vs. Manipulative Wording.** If charged language targets a specific actor's credibility, prefer Attack on Reputation; if it is general emotional colouring not aimed at discrediting an actor, prefer Manipulative Wording. Both may apply.

5.3 The six categories

ATTACK ON REPUTATION

Definition. The argument does not address the topic but targets a person, group, organisation, object, or activity in order to question or undermine their credibility. Includes name-calling/labelling, guilt by association, casting doubt on character, charging hypocrisy, and questioning moral standing.

Look for. insulting labels, smears, “who are they to talk,” associating the target with something discrediting, attacking the messenger instead of the message.

Positive example. *Calling an opponent a “puppet of foreign interests” instead of addressing their argument.*

Negative example. *Stating that an opponent's economic forecast is wrong and giving counter-figures is a substantive argument, NOT an Attack on Reputation — it addresses the claim, not the person.*

JUSTIFICATION

Definition. A statement paired with an appeal that is used to justify or support it: appeal to authority, to popularity (“everyone agrees”), to shared values, to national pride (flag-waving), or to fear/prejudice.

Look for. “experts say,” “everyone knows,” “as patriots we must,” appeals to fear to push or reject an idea, appeals to cherished values.

Positive example. *“Any true patriot supports this measure” justifies a position by appealing to group pride.*

Negative example. *Citing a named study with its actual findings to support a claim is ordinary evidence, NOT appeal-to-authority, unless the authority's mere say-so stands in place of evidence.*

SIMPLIFICATION

Definition. The argument excessively simplifies the issue: assigning a single cause where many exist (causal over-simplification), presenting a false either/or with no other options (false dilemma), or claiming one action will inevitably trigger a dramatic chain of consequences (consequential over-simplification).

Look for. “the sole reason is ...,” “either we do X or we are doomed,” slippery-slope chains.

Positive example. *“If we allow this, the whole country will collapse within a year” is a consequential over-simplification.*

Negative example. *Accurately stating that an event had several contributing causes is NOT Simplification — the fallacy requires collapsing real complexity into one cause or two choices.*

DISTRACTION

Definition. The argument shifts attention away from the real subject: attacking a distorted version of the opponent's position (strawman), introducing an irrelevant topic (red herring), or deflecting criticism by pointing at the accuser's faults (whataboutism).

Look for. “but what about ...,” refuting a claim the opponent never made, changing the subject to dodge the point.

Positive example. *Answering a corruption allegation with “And what about the corruption in their own party?” is whataboutism.*

Negative example. *Directly rebutting the opponent's actual argument, even forcefully, is NOT Distraction — the technique requires changing or distorting the subject.*

CALL

Definition. The text is not an argument but an encouragement to act or to think in a particular way: slogans, conversation-killers that shut down debate, and appeals that the time has come to act.

Look for. punchy slogans, “there is no alternative,” “now is the moment to ...,” phrases that end discussion.

Positive example. *“The time to act is now — hesitation is betrayal” combines an appeal to time with a conversation-killer.*

Negative example. *A neutral sentence reporting that a politician “called for talks” is NOT a Call technique — the article must itself urge the reader to act or think a certain way.*

MANIPULATIVE WORDING

Definition. The text is not an argument per se, but uses specific language — non-neutral, loaded, exaggerated, vague, or repeated — to impact the reader emotionally: loaded language, intentional vagueness/confusion, exaggeration or minimisation, and repetition.

Look for. emotionally charged word choice, “huge / catastrophic / tiny,” deliberately vague phrasing, the same charged phrase repeated for effect.

Positive example. *Describing a policy as a “monstrous, catastrophic betrayal” uses loaded language and exaggeration.*

Negative example. *Plain descriptive wording (“the government raised the tax by two percent”) is NOT Manipulative Wording, even if the reader happens to dislike the news.*

6. Layer 4 — Coded Language & Cultural Insider References

This is an additional category and the layer where annotator expertise matters most. It captures **language that an ordinary outsider would miss or misread**: phrases, metaphors, nicknames, dates, or allusions that carry a specific meaning for in-group readers but whose surface translation does not reveal that meaning.

6.1 What to flag

- **Coded phrases / euphemisms** wording that stands in for something else by convention (e.g. a period referred to obliquely, an event named by a place).
- **Cultural / political allusions** — references to a story, song, historical episode, or figure that the in-group recognises instantly.
- **Metaphors with insider meaning** — imagery whose force depends on shared cultural knowledge.
- **Loaded nicknames / labels** — names for people, groups or places that encode a stance.
- **Disambiguating references** — a word or name that an outsider (or an automatic system) would read in its ordinary sense, but which here points to a specific person, group, or event.

6.2 What to record

For each flagged item, record four things:

Field	What to write
The phrase	Annotate the span as precisely as possible. If the phrase cannot be marked as a contiguous span because it is distributed across multiple positions in the text, the entire span should be annotated. If the coded phrase is subtly distributed across a paragraph, the entire paragraph should be annotated.
Literal reading	What an outsider would understand from the surface words.
Insider meaning	What it actually signals to an in-group reader, in your own words.
Why it is coded	One line: the cultural / political knowledge an outsider would need but lack.

Note:

When annotating this label, first mark the relevant section in the text.

Then, select the corresponding label section on the right under the **“Regions”** tab.

This will open additional text boxes where you can provide an explanation for your annotation.

This layer is descriptive, not a fixed label set.

There is no closed list. Use your knowledge of the language and political culture. If you are unsure whether something is “coded enough,” flag it and note your uncertainty. The curator and team discussion will decide.

Over-flagging is cheaper than missing the exact phenomenon this project exists to study.

6.3 A worked example (illustrative)

Phrase: “the wild nineties” (*лихие девяностые*).

Literal reading: the 1990s described as turbulent.

Insider meaning: a politically loaded shorthand evoking post-Soviet chaos, used to legitimise a strong state by contrast.

Why coded: an outsider reads it as a neutral time reference and misses its function as state-aligned discourse.

(Annotators: replace this with real examples from your own language during the calibration round.)

7. A fully annotated mini-example

Illustrative only — schema mechanics, not a real article. The four layers are annotated independently.

Content: “While ordinary families struggle to pay their heating bills, the so-called reformers in the ministry — long known as puppets of foreign capitals — pushed through a law that experts warn will cripple the economy. Either we reverse course now, or our children inherit ruin. The people have had enough.”

Layer	Annotation	Why
L1 Roles	“ordinary families” → INNOCENT “the reformers / ministry” → ANTAGONIST	Families suffer (heating bills) without agency; officials are blamed and discredited.
L2 Frames	Economic; Political; Policy prescription & evaluation	Heating costs & “cripple the economy” (Economic); ministry/law (Political); a law evaluated as harmful (Policy).
L3 Persuasion	Attack on Reputation; Justification; Simplification; Call; Manipulative Wording	“puppets of foreign capitals” (Attack); “experts warn” (Justification); “either... or ruin” (false dilemma = Simplification); “reverse course now” / “had enough” (Call); “cripple,” “ruin” (Manipulative Wording).
L4 Coded	“puppets of foreign capitals”	Insider label encoding a sovereignty/foreign-interference narrative; flag with literal vs. insider meaning.

8. Disagreement, curation & quality

- **Two independent annotators** label each article. For each language there are three annotators (six in total); each article is assigned to two of its language's three. A **curator with the team** will discuss and then **consolidate**: merging complementary labels, resolving conflicts, and checking consistency.
- **Calibration round first.** Before full annotation, each team annotates the same small set, then meets to compare and refine this codebook. Examples here should be replaced with real cases from that round.
- **Inter-annotator agreement** will be measured (Krippendorff's α) per layer and per language, and reported as part of the dataset.

8.1 When you are unsure

6. Re-read the relevant passage. Decide on the basis of the text alone.
7. If still unsure, choose the label the text best supports and note the difficulty for the curator rather than leaving it blank.
8. Record systematic doubts (a recurring ambiguous case) so the team can add a rule. The codebook is expected to grow during calibration.

Appendix A — Source mapping

For transparency and for writing up the dataset, each layer maps to its published source as follows.

Layer	Source task	Our simplification
L1 Entity Roles	SemEval-2025 Task 10, ST1 (Entity Framing)	22 fine roles → 3 main roles (Protagonist / Antagonist / Innocent). Span-level rules retained partly, title is in-scope for L1 (KuKi adaptation; departs from ST1's title carve-out)
L2 Frames	SemEval-2023 Task 3, ST2 (Framing); Media Frames Corpus (Card et al. 2015)	Used as-is: 14 generic frames, document-level multi-label.
L3 Persuasion	SemEval-2023 Task 3, ST3 (Persuasion Techniques)	23 fine techniques → 6 coarse categories. Span-level, multi-label (each technique marked on the text span that carries it).
L4 Coded language	Project-specific (KuKi)	New open-text layer; no source taxonomy.
